

IntegrationMan[®]

IntegrationMan connects E-Commerce in the Cloud with SAP Business All-in-One

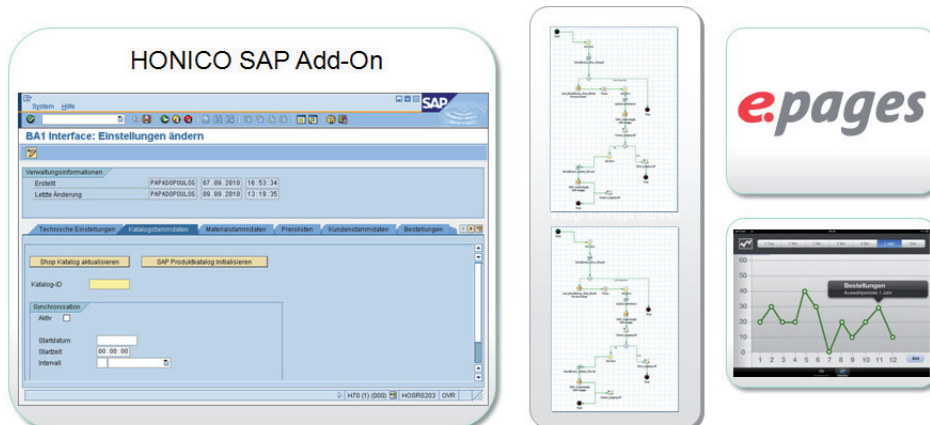

SAP^{Business} All-in-One

ePages

E-commerce as a new sales channel or as an additional service is becoming more and more standard in almost every industry and company. Online Shops and Internet portals became part of the system landscape of all enterprises – whether business partners use online platforms to handle their Business-to-Business (B2B) processes or end customers need to be reached through e-commerce platforms – Business-to-Consumer (B2C). There is a growing number of companies that decide to outsource their e-commerce platform and use services and solutions from the Cloud. E-commerce Cloud computing is offering ready-to-use Online Shop solutions and IT infrastructures that are dynamically customized to all specific requirements.

ePages Onlineshop and HONICO SAP Add-On

ePages and HONICO offer a complete solution to rent for SAP Business All-in-One customers. The Online Shop is provided by ePages in the Cloud and HONICO realizes the SAP Add-On, including all integration processes to manage and configure the Online Shop directly out of SAP Business All-in-One.

The image displays four components: a screenshot of the HONICO SAP Add-On interface showing 'BA1 Interface: Einstellungen ändern' with fields for 'Verwaltungsinformationen', 'Technische Einstellungen', and 'Synchronisation'; two SAP system diagrams showing hierarchical structures; the ePages logo; and a line chart titled 'Bestellungen' showing data points over 12 periods.

Technical Requirements

HONICO IntegrationMan, ePages standard SOAP interface and Java Connector (JCo) deliver the essential basis for the SAP eCommerce Connector to perform a smooth communication between SAP and Shop. IntegrationMan is SAP certified and delivers all integration processes. The Shop administration is then realized via this HONICO SAP Add-On.

SAP[®] Certified
Integration with SAP NetWeaver[®]

User Interface

The Shop can be managed via user interface that is available in the SAP GUI by SAP Business All-in-One. The user interface is transported routinely into SAP Business All-in-One and available with immediate effect.

Functionality

Via the user interface in SAP it is possible to manage the ePages eCommerce Connector, including all active processes and fields to be transferred.

The integration processes are activated event- or time-controlled. In order to communicate with SAP, standard function modules provided by SAP (BABIs) and function modules provided by HONICO are accessed via RFC. All data is being checked, mapped and, if necessary, converted in the operational process.

All processes to transfer master and transaction data are managed via the HONICO SAP user interface. This can be realized in collaboration with your SAP Partner.

- Processes to transfer master and transaction data between SAP Business All-in-One and ePages Online Shop
 - » Catalog data
 - » Article data
 - » User data
 - » Orders
- Processes for system security and in case of failure

In addition to all existing standard integration processes, additional processes can be realized. However, the realization is performed outside of the ePages Base and Flex Offer in conjunction with your SAP Partner and ePages.

- Additional integration processes
 - » Transfer of product images and further product data out of a file system or product information system (PIM) into the Shop
 - » Transfer of invoice data and other documents out of SAP or a file system into the Shop
 - » Establish an order history out of SAP and transfer into the Shop
 - » Establish freight costs and blocked deliveries
 - » Establish customized prices connected to articles or a basket of goods out of SAP
 - » Transmit gift certificates
 - » Etc.

iPhone / iPad App

The available App shows order information out of SAP in realtime.
